DIGITAL NATURALIST - AI ENABLED TOOL FOR BIODIVERSITY RESEARCHERS

INTRODUCTION

PROJECT OVERVIEW:

The over of the project is to provide the information of the plants, animals and flowers. A naturalist is someone who studies the patterns of nature, identifies a different kind of flora and fauna in nature. Being able to identify the flora and fauna around us often leads to an interest in protecting wild spaces, and collecting and sharing information about the species we see on our travels is very useful for conservation groups like NCC.

When venturing into the woods, field naturalists usually rely on common approaches like always carrying a guidebook around everywhere or seeking help from experienced ornithologists. There should be a handy tool for them to capture, identify and share the beauty to the outside world.

PROJECT PURPOSE:

The main purpose of the project is to be an guide for the person who want to know the information about the plants, animals, flowers and birds. It is an AI enabled tool which is helpful to the person who don't know about the flora and fauna.

LITERATURE SURVEY

EXISTING PROBLEM:

In the previous model the accuracy of the images are confused and it may show the wrong output and it provide the incorrect information to the client or person and it has an limited amount of the data. The increasing availability of digital images, coupled with sophisticated artificial intelligence (AI) techniques for image classification, presents an exciting opportunity for biodiversity researchers to create new datasets of species observations. We investigated whether an AI plant species classifier could extract previously unexploited biodiversity data from social media photos (Flickr). We found over 60,000 geolocated images tagged with the keyword "flower" across an urban and rural location in the UK and classified these using AI, reviewing these identifications and assessing the representativeness of images. Images were predominantly biodiversity focused, showing single species. Non-native garden plants dominated, particularly in the urban setting. The AI classifier performed best when photos were focused on single native species in wild situations but also performed well at higher taxonomic levels (genus and family), even when images substantially deviated from this. We present a checklist of questions that should be considered when undertaking a similar analysis.

REFERENCE:

- 1. AI Naturalists Might Hold the Key to Unlocking Biodiversity Data in Social Media Imagery.
- 2. Enabling Biodiversity Research with Automated Species Identification.
- 3. Plant Identification Using Artificial Intelligence Innovative Strategies for Teaching Food Biodiversity.
- 4. iNaturalist opens up a wealth of nature data and computer vision challenges.
- 5. Researchers get AI help to map ecosystem, wildlife conservation.

PROBLEM STATEMENT DEFINITION:

To provide the information about of plants, animals, flowers and birds the pervious system provides the limited amount of the data in current project we are going to rectify it.

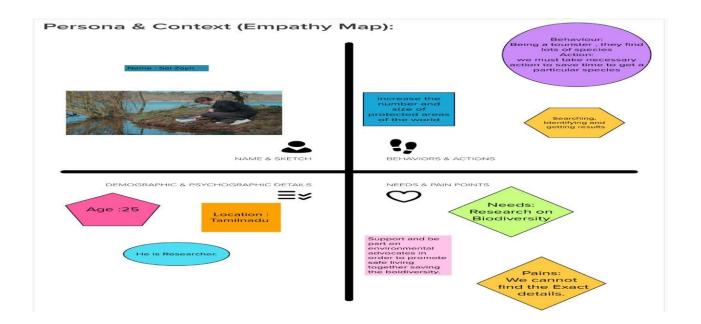

IDEATION AND PROPOSED SOLUTION

EMPATHY MAP CANVAS:

Biodiversity is the variety of different forms of life on earth, including the different plants, animals, microorganisms, the genes they contain and the ecosystem they form. Biodiversity is the life support system

There are millions of species of plants and animals; every single variety could be valuable one day or the others.

Human beings cannot exist without the abundance and diversity of these biological resources.

REQUIREMENT ANALYSIS

REQUIREMENTS:

Anaconda Navigator

Keras

Tensorflow

Sklearn

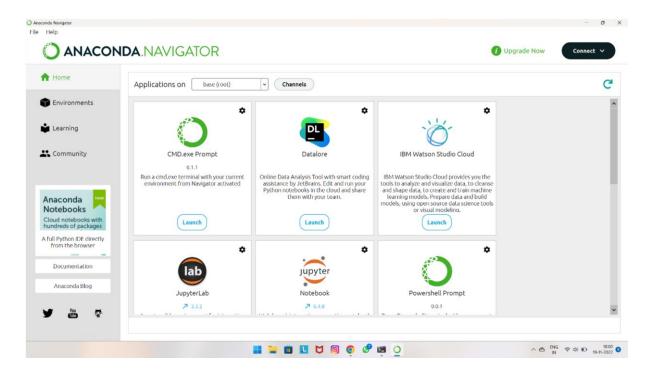

Pandas

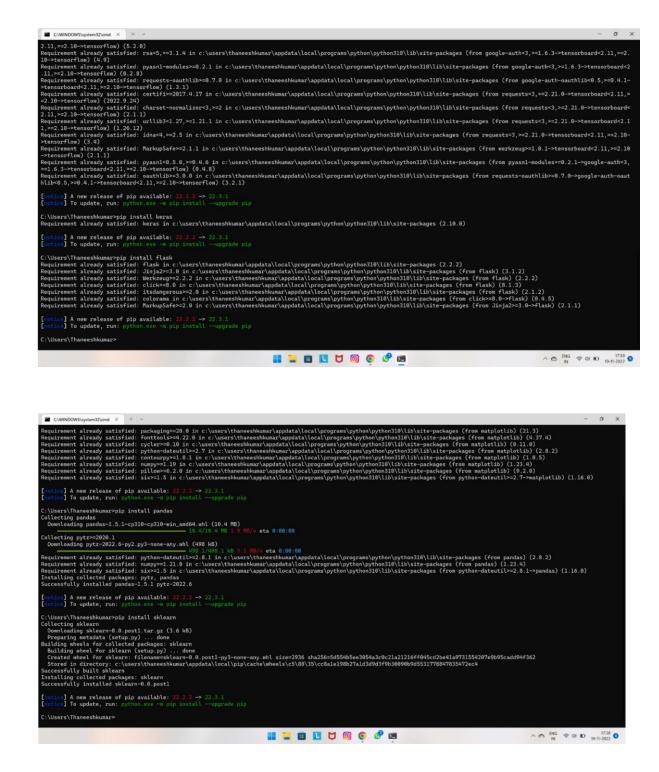

Numpy

Flask

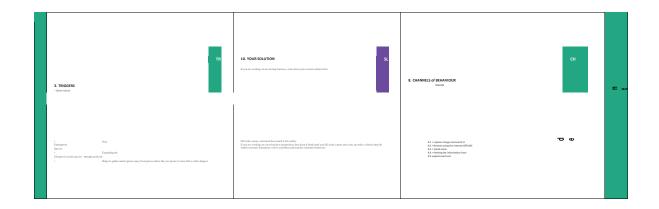

Matplotlib

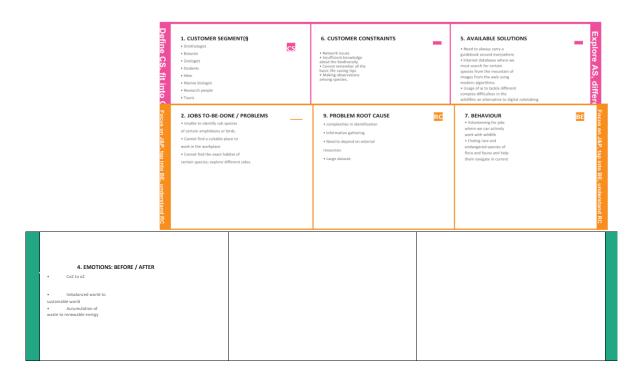

Opency-python

PROBLEM SOLUTION FIT:

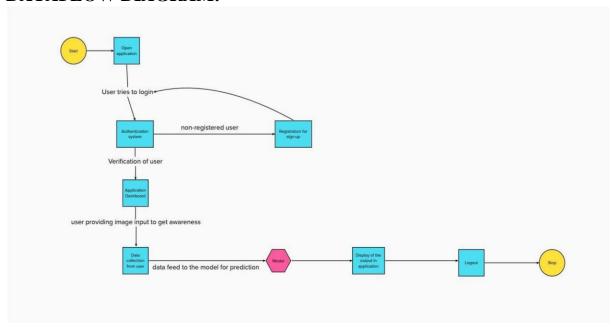

PROBLEM SOLUTION FIT:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	To identify a species in a forest or in any other place, we need to carry a heavy book or seek a professional like botanist or zoologist or an ornithologist, but there should be a handy tool for them to capture, identify and share the beauty to the outside world.

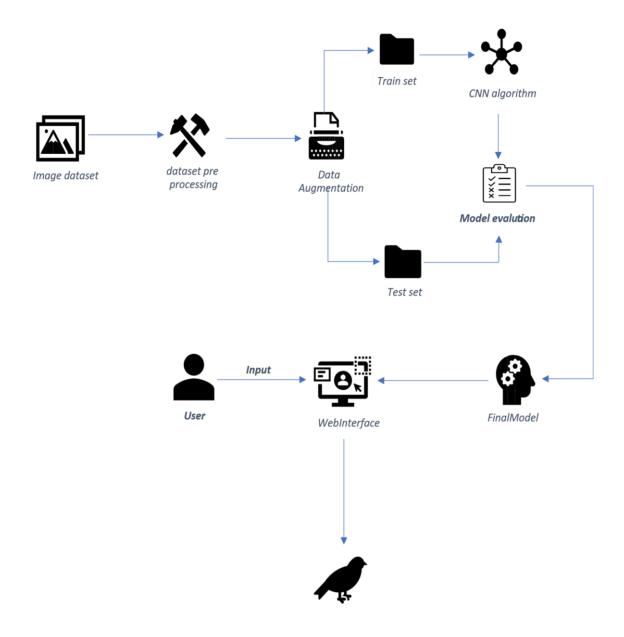

2.	Idea / Solution description	A system is built by using the Image/object recognition and classification using (CNN) Convolutional neural network which while using this system, we can capture the image of any animals and plants and can obtain the information about the flora and fauna at any time.
3.	Novelty / Uniqueness	Use of transfer learning in pre trained models to increase accuracy and training time along with data augmentation to increase the dataset size which will in turn yield more accuracy
4.	Social Impact / Customer Satisfaction	The user can identify the type of species faster and easier without searching in books page by page. It is a useful product for all the research analyst, Ornithologist, Biologist and Marine drivers who can instantly capture images of different species and are able to get all the relevant information about those breeds.
5.	Business Model (Revenue Model)	The model could be open sourced, but we can get some revenue via ads. we will also add a few extra applications like storage and bookmarks permanently for a specific amount of payment.

```

OUTPUT:

ADVANTAGES:

It is useful to find the new variety of plants, animals and flowers and etc.

It is very useful for client.

Easy to build.

Easy to use.

DISADVANTAGE:

It is little hard to use at the first stage.

It cost is high

It need more amount of space of memory.

CONCLUSION:

By combining social media APIs with AI classifiers, we were able to build an AI naturalist capable of creating biodiversity datasets from previously unexploited data sources. However, we demonstrate that there are a number of biases in the data produced, some of which may be able to be mitigated against, that must be carefully considered before the data could be used in certain types of analyses.

FUTURESCOPE:

The future scope of the project is to develop the AI tool into an Most used application for the client and we will add the more number of varieties of the plant, animals, plants and sea animals and etc.
